EXHAUST PIPE FINISHING

Ferrita Sweden AB main business area is design and production of stainless steel exhaust systems, mainly for passenger cars in both standard, sports and racing designs. Besides exhaust pipe activity this company also manufactures other special systems for various types of vehicles and machines in stainless steel tubes.

Through dedicated investments in product development and quality, Ferrita has developed into one of the leading manufacturers of stainless steel exhaust systems in it's business area.

"With this investment (of ML 150 Round Tube Finishing Machine), we have improved our product finishing quality one step further", according to Ferrita CEO, Micael Ljungstrom. "...With a more efficient production method, we are also able now to make inside our production a higher proportion of external tube finishing jobs" says Micael.

This technology provides significant time savings, combined with better and more uniform surface finishing results.

At Ferrita website www.ferrita.com you may see different examples of exhaust pipes. Visit the YouTube website to see the video where Ferrita shows how they are using ML150 in their tube finishing applications.

"Sometimes the customer is satisfied with a high quality stainless steel exhaust system. Sometimes they ask for something more.

We have invested in a new machine that sweeps the surface with a smoother results than many other technologies. The machine has two abrasive belts mounted on a rotating wheel.

Round or oval, long or short, straight or curved tubes gets a surface finish far from the origin.

Simply a better looking result!"
